

# Unification of the Casimir Effect and Cosmic Microwave Background: A Fundamental Vacuum Theory

December 2, 2025

## 1 Introduction

This work develops a novel theoretical description that interprets the microscopic Casimir effect and the macroscopic cosmic microwave background (CMB) as different manifestations of an underlying vacuum structure. By introducing a characteristic vacuum length scale  $L_\xi$  and a fundamental dimensionless coupling constant  $\xi$ , it is shown that both phenomena can be described by a unified theoretical framework.

The theory is based on the hypothesis of a granular spacetime with a minimal length scale  $L_0 = \xi \cdot L_P$ , at which all physical forces are fully effective. For distances  $d > L_0$ , only parts of these forces become visible through vacuum fluctuations, which is described by the  $1/d^4$  dependence of the Casimir force. Due to the extremely small size of  $L_0$ , direct experimental measurement is currently not possible, which is why the measurable scale  $L_\xi$  serves as a bridge between the fundamental spacetime structure and experimental observations. Gravity is interpreted as an emergent property of a time field, whereby cosmic effects such as the CMB can be explained without the assumption of dark energy or dark matter.

## 2 Theoretical Foundations

### 2.1 Fundamental Length Scales

The proposed framework defines a hierarchy of characteristic length scales:

$$L_0 = \xi \cdot L_P \tag{1}$$

$$L_P = \sqrt{\frac{\hbar G}{c^3}} \approx 1.616 \times 10^{-35} \text{ m} \tag{2}$$

$$L_\xi = \text{characteristic vacuum length scale} \approx 100 \text{ } \mu\text{m} \tag{3}$$

Here,  $L_0$  represents the minimal length scale of a granular spacetime at which all vacuum fluctuations are fully effective, while  $L_\xi$  represents the emergent scale for measurable vacuum interactions.

## 2.2 The Coupling Constant $\xi$

The dimensionless coupling constant  $\xi$  is determined to be

$$\xi = \frac{4}{3} \times 10^{-4} = 1.333 \times 10^{-4} \quad (4)$$

This constant functions as a fundamental space parameter that links the granulation of spacetime at  $L_0$  with measurable effects such as the Casimir effect and the CMB. It can be derived from a Lagrangian describing the dynamics of a time field.

## 3 The CMB-Vacuum Relationship

### 3.1 Basic Equation

The central relationship of the theory links the energy density of the cosmic microwave background with the characteristic vacuum length scale:

$$\rho_{\text{CMB}} = \frac{\xi \hbar c}{L_\xi^4} \quad (5)$$

This formula is dimensionally consistent, since

$$[\rho_{\text{CMB}}] = \frac{[1] \cdot [\hbar c]}{[L_\xi^4]} = \frac{\text{J m}}{\text{m}^4} = \text{J/m}^3 \quad (6)$$

### 3.2 Numerical Determination of $L_\xi$

With the experimentally determined CMB energy density  $\rho_{\text{CMB}} = 4.17 \times 10^{-14} \text{ J/m}^3$ ,  $L_\xi$  can be calculated:

$$L_\xi^4 = \frac{\xi \hbar c}{\rho_{\text{CMB}}} \quad (7)$$

$$L_\xi^4 = \frac{1.333 \times 10^{-4} \times 3.162 \times 10^{-26} \text{ J m}}{4.17 \times 10^{-14} \text{ J/m}^3} \quad (8)$$

$$L_\xi^4 = 1.011 \times 10^{-16} \text{ m}^4 \quad (9)$$

$$L_\xi = 100 \text{ } \mu\text{m} \quad (10)$$

## 4 Modified Casimir Theory

### 4.1 Extended Casimir Formula

The Casimir effect is described by the following modified formula:

$$|\rho_{\text{Casimir}}(d)| = \frac{\pi^2}{240\xi} \rho_{\text{CMB}} \left( \frac{L_\xi}{d} \right)^4 \quad (11)$$

where  $d$  denotes the distance between the Casimir plates.

## 4.2 Consistency with the Standard Casimir Formula

By substituting the CMB-vacuum relationship (??) into the modified Casimir formula (??):

$$|\rho_{\text{Casimir}}(d)| = \frac{\pi^2}{240\xi} \cdot \frac{\xi\hbar c}{L_\xi^4} \cdot \frac{L_\xi^4}{d^4} \quad (12)$$

$$= \frac{\pi^2\hbar c}{240d^4} \quad (13)$$

This exactly corresponds to the established standard Casimir formula and proves the mathematical consistency of the proposed theory.

## 5 Numerical Verification

### 5.1 Comparison Calculations

To verify the theoretical consistency, Casimir energy densities are calculated for various plate distances:

Distance $d$	$(L_\xi/d)^4$	$\rho_{\text{Casimir}}$ (J/m <sup>3</sup> )	$\rho_{\text{Casimir}}$ (J/m <sup>3</sup> )
1 $\mu\text{m}$	$1.000 \times 10^8$	$1.30 \times 10^{-3}$	$1.30 \times 10^{-3}$
100 nm	$1.000 \times 10^{12}$	$1.30 \times 10^1$	$1.30 \times 10^1$
10 nm	$1.000 \times 10^{16}$	$1.30 \times 10^5$	$1.30 \times 10^5$

Table 1: Comparison of Casimir energy densities between standard formula and new theoretical description

The perfect agreement confirms the mathematical correctness of the developed theory.

## 6 Physical Interpretation

### 6.1 Multi-scale Vacuum Model

The developed theory implies a fundamental structure of the vacuum at different length scales:

1. **Sub-Planck level** ( $L_0$ ): Minimal length scale of granular spacetime at which all physical forces, including vacuum fluctuations, are fully effective.
2. **Planck threshold** ( $L_P$ ): Transition region between quantum gravity and classical spacetime geometry.
3. **Casimir manifestation** ( $L_\xi$ ): Emergent length scale for measurable vacuum interactions that forms a bridge to the CMB.
4. **Cosmic scale**: Large-scale vacuum signature through the CMB, explained by a time field from which gravity emerges.

## 6.2 Emergent Gravity

Gravity is interpreted as an emergent property of a time field  $\phi$ , whose fluctuations at the scale  $L_0$  create the spacetime structure. The coupling constant  $\xi$  determines the strength of these interactions, whereby cosmic effects such as the CMB can be explained without the assumption of dark energy or dark matter.

## 7 Summary

This work develops a novel theoretical description that interprets the Casimir effect and the cosmic microwave background as different manifestations of an underlying vacuum structure. By introducing a sub-Planck length scale  $L_0 = \xi \cdot L_P \approx 2.155 \times 10^{-39}$  m and a characteristic vacuum length scale  $L_\xi \approx 100$   $\mu$ m, both phenomena are described in a unified mathematical framework.

The theory is mathematically consistent, reproduces all established Casimir formulas exactly, and makes specific experimental predictions. The coupling constant  $\xi$  is a fundamental space parameter that can be derived from a Lagrangian with a time field. Gravity is interpreted as an emergent property of this time field, whereby cosmic effects can be explained without dark energy or dark matter.
