

Conceptual Comparison of Unified Natural Units and Extended Standard Model:

Field-Theoretic vs. Dimensional Approaches in the $\alpha_{\text{EM}} = \beta_T = 1$ Framework

Abstract

This paper presents a detailed conceptual comparison between the unified natural unit system with $\alpha_{\text{EM}} = \beta_T = 1$ and the Extended Standard Model, focusing on their respective treatments of the intrinsic time field and scalar field modifications. While mathematically equivalent in certain operational modes, these frameworks represent fundamentally different conceptual approaches to the unification of quantum mechanics and general relativity. We analyze the ontological status, physical interpretation, and mathematical formulation of both models, with particular attention to their gravitational aspects within the unified framework where both dimensional and dimensionless coupling constants achieve natural unity values [?]. We demonstrate that the unified natural unit approach offers greater conceptual simplicity and intuitive clarity compared to the Extended Standard Model's dimensional extensions. This comparison reveals that although both frameworks yield identical experimental predictions in unified reproduction mode, including a static universe without expansion where redshift occurs through gravitational energy attenuation rather than cosmic expansion, the unified natural unit system provides a more elegant and conceptually coherent description of physical reality through self-consistent derivation of fundamental parameters rather than requiring additional scalar field constructs. The Extended Standard Model's dual operational capability—both as a practical extension of conventional Standard Model calculations and as a mathematical reformulation of unified system results—demonstrates its utility while highlighting the fundamental ontological indistinguishability between mathematically equivalent theories. The implications for our understanding of quantum gravity and cosmology within the unified framework are discussed [?, ?].

0.1 Introduction

The pursuit of a unified theory that coherently describes both quantum mechanics and general relativity remains one of the most significant challenges in theoretical physics. Recent developments in natural unit systems have demonstrated that when physical theories are formulated in their most natural units, fundamental coupling constants achieve unity values, revealing deeper connections between seemingly disparate phenomena [?]. This paper examines two mathematically equivalent but conceptually distinct approaches: the unified natural unit system where $\alpha_{\text{EM}} = \beta_T = 1$ emerges from self-consistency requirements, and the Extended Standard Model (ESM) which can operate in dual modes—either as a practical extension of conventional Standard Model calculations or as a mathematical reformulation adopting all parameter values from the unified framework.

It is crucial to distinguish between three theoretical frameworks and the ESM's dual operational modes:

- **Standard Model (SM):** The conventional framework with $\alpha_{\text{EM}} \approx 1/137$, cosmic expansion, dark matter, and dark energy [?, ?]
- **Extended Standard Model Mode 1 (ESM-1):** Extends conventional SM calculations with scalar field corrections while maintaining $\alpha_{\text{EM}} \approx 1/137$
- **Extended Standard Model Mode 2 (ESM-2):** Adopts ALL parameter values and predictions from the unified system but maintains conventional unit interpretations and scalar field formalism
- **Unified Natural Unit System:** Self-consistent framework where $\alpha_{\text{EM}} = \beta_T = 1$ emerges from theoretical principles [?]

The ESM-2 and unified system are completely mathematically equivalent—they make identical predictions for all observable phenomena. The only difference lies in their conceptual interpretation and theoretical foundations. Importantly, there exists no ontological method to distinguish experimentally between these mathematically equivalent descriptions of reality [?, ?].

The unified natural unit system represents a paradigm shift where both dimensional constants (\hbar , c , G) and dimensionless coupling constants (α_{EM} , β_T) achieve unity through theoretical self-consistency rather than empirical fitting [?]. This approach demonstrates that electromagnetic and gravitational interactions achieve the same coupling strength in natural units, suggesting they may be different aspects of a unified interaction.

In contrast, the Extended Standard Model preserves conventional notions of relative time and constant mass while introducing a scalar field Θ that modifies the Einstein field equations. In ESM-2 mode, it adopts ALL parameter values, predictions, and observable consequences from the unified system—it is not an independent theory but rather a different mathematical formulation of the same physics. Both ESM-2 and the unified system make identical predictions for:

- Static universe cosmology (no cosmic expansion)
- Wavelength-dependent redshift through gravitational energy attenuation: $z(\lambda) = z_0(1 + \ln(\lambda/\lambda_0))$
- Modified gravitational potential: $\Phi(r) = -GM/r + \kappa r$
- CMB temperature evolution: $T(z) = T_0(1 + z)(1 + \ln(1 + z))$
- All quantum electrodynamic precision tests [?]

The difference lies purely in conceptual framework: the unified approach derives these from self-consistent principles, while ESM-2 achieves them through scalar field modifications that reproduce unified system results.

This paper examines the conceptual differences between these frameworks, with particular focus on:

- The distinction between Standard Model (SM) and Extended Standard Model operational modes
- The complete mathematical equivalence between ESM-2 and unified natural units
- The ontological indistinguishability of mathematically equivalent theories
- The self-consistent derivation of $\alpha_{\text{EM}} = \beta_T = 1$ versus scalar field parameter adoption
- The gravitational mechanism for redshift through energy attenuation rather than cosmic expansion [?, ?]
- The ontological status and physical interpretation of the respective fields
- The mathematical formulation of gravitational interactions within unified natural units [?]
- The relative conceptual clarity and elegance of each approach
- The implications for quantum gravity and cosmological understanding

Our analysis reveals that while the Extended Standard Model represents mathematically equivalent formulations to the unified system in its Mode 2 operation, the unified natural unit system offers superior conceptual clarity by deriving both electromagnetic and gravitational phenomena from a single, self-consistent theoretical framework [?].

0.2 Mathematical Equivalence Within the Unified Framework

Before examining conceptual differences, it is essential to establish the mathematical equivalence of the unified natural unit system and the Extended Standard Model's Mode 2 operation. This equivalence ensures that any distinction between them is purely conceptual rather than empirical, as both frameworks yield identical experimental predictions [?].

0.2.1 Unified Natural Unit System Foundation

The unified natural unit system is built on the principle that truly natural units should eliminate not just dimensional scaling factors, but also numerical factors that obscure fundamental relationships. This leads to the requirement:

$$\hbar = c = G = k_B = \alpha_{\text{EM}} = \beta_T = 1 \quad (1)$$

These unity values are not imposed arbitrarily but derived from the requirement that the theoretical framework be internally consistent and dimensionally natural [?]. The key insight is that when this principle is applied rigorously, both α_{EM} and β_T naturally assume unity values through self-consistency requirements rather than empirical adjustment.

0.2.2 Transformation Between Frameworks

The mathematical equivalence between the unified system and the Extended Standard Model's Mode 2 operation can be demonstrated through the transformation relationship. The scalar field Θ in ESM-2 and the intrinsic time field $T(\vec{x}, t)$ in the unified system are related by:

$$\Theta(\vec{x}, t) \propto \ln \left(\frac{T(\vec{x}, t)}{T_0} \right) \quad (2)$$

where T_0 is the reference time field value in the unified system. However, this transformation reveals a fundamental conceptual difference: the unified system derives $T(\vec{x}, t)$ from first principles through the relationship:

$$T(\vec{x}, t) = \frac{1}{\max(m(x, t), \omega)} \quad (3)$$

while ESM-2 introduces Θ to reproduce unified system results without independent physical foundation [?].

0.2.3 Gravitational Potential in Both Frameworks

Both frameworks predict an identical modified gravitational potential:

$$\Phi(r) = -\frac{GM}{r} + \kappa r \quad (4)$$

However, the parameter κ has different origins in each framework:

Unified Natural Units: κ emerges naturally from the unified framework through:

$$\kappa = \alpha_\kappa H_0 \xi \quad (5)$$

where $\xi = 2\sqrt{G} \cdot m$ is the scale parameter connecting Planck and particle scales [?].

Extended Standard Model Mode 2: Adopts the same parameter values and all predictions from the unified system but achieves them through scalar field modifications of Einstein's equations rather than natural unit consistency. ESM-2 is mathematically identical to the unified system—it makes the same predictions for all observables by construction.

0.2.4 Mathematical Equivalence vs. Theoretical Independence

It is essential to understand that ESM-2 and the unified natural unit system are not competing theories with different predictions. They are two different mathematical formulations of identical physics:

- **Identical Predictions:** Both predict static universe, wavelength-dependent redshift, modified gravity, etc.
- **Identical Parameters:** ESM-2 adopts all parameter values derived in the unified system
- **Complete Equivalence:** Every calculation in one framework can be translated to the other
- **Ontological Indistinguishability:** No experimental test can determine which description represents "true" reality [?]
- **Different Conceptual Basis:** Unity through natural units vs. scalar field modifications

This is fundamentally different from the Standard Model, which makes completely different predictions (expanding universe, wavelength-independent redshift, dark matter/energy requirements, etc.) [?, ?].

0.2.5 Field Equations in Unified Context

In the unified natural unit system, the field equation for the intrinsic time field becomes:

$$\nabla^2 m(x, t) = 4\pi\rho(x, t) \cdot m(x, t) \quad (6)$$

where $G = 1$ in natural units. This leads to the time field evolution:

$$\nabla^2 T(\vec{x}, t) = -\rho(x, t)T(\vec{x}, t)^2 \quad (7)$$

In the Extended Standard Model Mode 2, the modified Einstein field equations are:

$$G_{\mu\nu} + \kappa g_{\mu\nu} = 8\pi G T_{\mu\nu} + \nabla_\mu \Theta \nabla_\nu \Theta - \frac{1}{2} g_{\mu\nu} (\nabla_\sigma \Theta \nabla^\sigma \Theta) \quad (8)$$

While mathematically equivalent under the appropriate transformation, the unified system derives its equations from fundamental principles [?], while ESM-2 introduces modifications to reproduce unified system predictions without independent theoretical justification.

0.3 The Unified Natural Unit System's Intrinsic Time Field

The unified natural unit system represents a revolutionary reconceptualization of fundamental physics where the equality $\alpha_{\text{EM}} = \beta_T = 1$ emerges from theoretical self-consistency rather than empirical adjustment [?]. This section examines the nature and properties of the intrinsic time field $T(\vec{x}, t)$ within this unified framework.

0.3.1 Self-Consistent Definition and Physical Basis

In the unified system, the intrinsic time field is defined through the fundamental time-mass duality:

$$T(\vec{x}, t) = \frac{1}{\max(m(x, t), \omega)} \quad (9)$$

where all quantities are expressed in natural units with $\hbar = c = 1$. This definition emerges from the requirement that:

- Energy, time, and mass are unified: $E = \omega = m$
- The intrinsic time scale is inversely proportional to the characteristic energy
- Both massive particles and photons are treated within a unified framework
- The field varies dynamically with position and time according to local conditions

The self-consistency condition requires that electromagnetic interactions ($\alpha_{\text{EM}} = 1$) and time field interactions ($\beta_T = 1$) have the same natural strength, eliminating arbitrary numerical factors [?].

0.3.2 Dimensional Structure in Natural Units

The unified natural unit system establishes a complete dimensional framework where all physical quantities reduce to powers of energy:

Criterion	Unified Natural Units	ESM Mode 1	ESM Mode 2
Simplicity	High (self-consistent)	Medium (SM + corrections)	Medium (parameter adoption)
Elegance	High (natural unity)	Medium (phenomenological)	Low (derivative formulation)
Unification	Complete (EM-gravity)	Partial (conventional + scalar)	Complete (by construction)
Explanatory Power	High (natural emergence)	Medium (empirical flexibility)	Low (result reproduction)
Conceptual Clarity	High (clear meaning)	Medium (hybrid approach)	Low (abstract constructs)
Predictive Precision	High (parameter-free)	Variable (adjustable)	High (by design)
Practical Utility	Medium (requires relearning)	High (extends familiar)	Low (no new insights)
