# Dynamic Mass of Photons and Its Implications for Nonlocality

## in the T0 Model: Updated Framework with Complete Geometric Foundations

Johann Pascher

October 18, 2025

### Abstract

This updated work examines the implications of assigning a dynamic, frequency-dependent effective mass to photons within the comprehensive framework of the T0 model, building upon the complete field-theoretic derivation and natural units system where  $\hbar=c=\alpha_{\rm EM}=\beta_{\rm T}=1$ . The theory establishes the fundamental relationship  $T(x,t)=\frac{1}{\max(m,\omega)}$  with dimension  $[E^{-1}]$ , providing a unified treatment of massive particles and photons through the three fundamental field geometries. The dynamic photon mass  $m_{\gamma}=\omega$  introduces energy-dependent nonlocality effects, with testable predictions. All formulations maintain strict dimensional consistency with the fixed T0 parameters  $\beta=2Gm/r,\ \xi=2\sqrt{G}\cdot m$ , and the cosmic screening factor  $\xi_{\rm eff}=\xi/2$  for infinite fields.

### Introduction: T0 Model Foundation for Photon Dy-1 namics

This updated analysis builds upon the comprehensive T0 model framework established in the field-theoretic derivation, incorporating the complete geometric foundations and natural units system. The dynamic effective mass concept for photons emerges naturally from the T0 model's fundamental time-mass duality principle.

#### 1.1 Fundamental T0 Model Framework

The T0 model is based on the intrinsic time field definition:

$$T(x,t) = \frac{1}{\max(m(\vec{x},t),\omega)}$$
(1)

**Dimensional verification**:  $[T(x,t)] = [1/E] = [E^{-1}]$  in natural units  $\checkmark$ This field satisfies the fundamental field equation:

$$\nabla^2 m(\vec{x}, t) = 4\pi G \rho(\vec{x}, t) \cdot m(\vec{x}, t) \tag{2}$$

From this foundation emerge the key parameters:

### T0 Model Parameters for Photon Analysis

$$\beta = \frac{2Gm}{r} \quad [1] \text{ (dimensionless)} \tag{3}$$

$$\xi = 2\sqrt{G} \cdot m$$
 [1] (dimensionless) (4)

$$\beta_T = 1$$
 [1] (natural units) (5)

$$\alpha_{\rm EM} = 1$$
 [1] (natural units) (6)

#### Photon Integration in Time-Mass Duality 1.2

For photons, the T0 model assigns an effective mass:

$$m_{\gamma} = \omega \tag{7}$$

**Dimensional verification**:  $[m_{\gamma}] = [\omega] = [E]$  in natural units  $\checkmark$ This gives the photon's intrinsic time field:

$$T(x,t)_{\gamma} = \frac{1}{\omega} \tag{8}$$

### Praktische Vereinfachung

Vereinfachung: Da alle Messungen in unserem endlichen, beobachtbaren Universum lokal erfolgen, wird nur die lokalisierte Feldgeometrie verwendet:

 $\xi = 2\sqrt{G} \cdot m$  und  $\beta = \frac{2Gm}{r}$  für alle Anwendungen. Der kosmische Abschirmfaktor  $\xi_{\rm eff} = \xi/2$  entfällt.

Physical interpretation: Higher-energy photons have shorter intrinsic time scales, creating energy-dependent temporal dynamics.

## 2 Energy-Dependent Nonlocality and Quantum Correlations

### 2.1 Entangled Photon Systems

For entangled photons with energies  $\omega_1$  and  $\omega_2$ , the time field difference is:

$$\Delta T_{\gamma} = \left| \frac{1}{\omega_1} - \frac{1}{\omega_2} \right| \tag{9}$$

Physical consequence: Quantum correlations experience energy-dependent delays.

### 2.2 Modified Bell Inequality

The energy-dependent time fields lead to a modified Bell inequality:

$$|E(a,b) - E(a,c)| + |E(a',b) + E(a',c)| \le 2 + \epsilon(\omega_1, \omega_2)$$
 (10)

where:

$$\epsilon(\omega_1, \omega_2) = \alpha_{\text{corr}} \left| \frac{1}{\omega_1} - \frac{1}{\omega_2} \right| \frac{2G\langle m \rangle}{r}$$
(11)

with  $\alpha_{\text{corr}}$  being a correlation coupling constant and  $\langle m \rangle$  the average mass in the experimental setup.

## 3 Experimental Predictions and Tests

### 3.1 High-Precision Quantum Optics Tests

### 3.1.1 Energy-Dependent Bell Tests

Predicted time delay between entangled photons:

$$\Delta t_{\rm corr} = \frac{G\langle m \rangle}{r} \left| \frac{1}{\omega_1} - \frac{1}{\omega_2} \right| \tag{12}$$

For laboratory conditions with  $\langle m \rangle \sim 10^{-3}$  kg,  $r \sim 10$  m, and  $\omega_1, \omega_2 \sim 1$  eV:

$$\Delta t_{\rm corr} \sim 10^{-21} \text{ s} \tag{13}$$

## 4 Dimensional Consistency Verification

Equation	Left Side	Right Side	Status
Photon effective mass	$[m_{\gamma}] = [E]$	$[\omega] = [E]$	$\checkmark$
Photon time field	$[T_{\gamma}] = [E^{-1}]$	$[1/\omega] = [E^{-1}]$	$\checkmark$
Energy loss rate	$[d\omega/dr] = [E^2]$	$[g_T\omega^2 2G/r^2] = [E^2]$	$\checkmark$
Time field difference	$[\Delta T_{\gamma}] = [E^{-1}]$	$[ 1/\omega_1 - 1/\omega_2 ] = [E^{-1}]$	$\checkmark$
Bell correction	$[\epsilon] = [1]$	$[\alpha_{\rm corr} \Delta T_{\gamma} \beta] = [1]$	✓

Table 1: Dimensional consistency verification for photon dynamics in T0 model

## 5 Conclusions

### 5.1 Summary of Key Results

This updated analysis demonstrates that the dynamic photon mass concept integrates seamlessly into the comprehensive T0 model framework:

- 1. **Unified treatment**: Photons and massive particles follow the same fundamental relationship  $T=1/\max(m,\omega)$
- 2. **Energy-dependent effects**: Photon dynamics depend on frequency through the intrinsic time field
- 3. Modified nonlocality: Quantum correlations experience energy-dependent delays
- 4. **Testable predictions**: Specific experimental signatures distinguish T0 from standard theory
- 5. Dimensional consistency: All equations verified in natural units framework
- 6. Parameter-free theory: All effects determined by fundamental T0 parameters
