Abstract

This document presents the cosmological aspects of the T0-Theory with the universal ξ-parameter as the foundation for a static, eternally existing universe. Based on the time-energy duality, it is shown that a Big Bang is physically impossible and that the cosmic microwave background radiation (CMB) as well as the Casimir effect can be understood as two manifestations of the same ξ-field. As the sixth document of the T0 series, it integrates the cosmological applications of all established basic principles.

1 Introduction

1.1 Cosmology within the Framework of the T0-Theory

The T0-Theory revolutionizes our understanding of the universe through the introduction of a fundamental relationship between the microscopic quantum vacuum and macroscopic cosmic structures. All cosmological phenomena can be derived from the universal parameter $\xi = \frac{4}{3} \times 10^{-4}$.

Central Thesis of T0-Cosmology:

The universe is static and eternally existing. All observed cosmic phenomena arise from manifestations of the fundamental ξ-field, not from spacetime expansion.

1.2 Connection to the T0 Document Series

This cosmological analysis builds on the fundamental insights of the previous T0 documents:

- **T0_Basics_It.tex:** Geometric parameter ξ and fractal spacetime structure

- **T0_FineStructure_It.tex:** Electromagnetic interactions in the ξ-field

- **T0_GravitationalConstant_It.tex:** Gravitation theory from ξ-geometry

- **T0_ParticleMasses_It.tex:** Mass spectrum as the basis for cosmic structure formation

- **T0_Neutrinos_It.tex:** Neutrino oscillations in cosmic dimensions

2 Time-Energy Duality and the Static Universe

2.1 Heisenberg's Uncertainty Principle as a Cosmological Principle

> **Fundamental Insight:**
> Heisenberg's uncertainty principle $\Delta E \times \Delta t \geq \frac{\hbar}{2}$ irrefutably proves that a Big Bang is physically impossible.

In natural units ($\hbar = c = k_B = 1$), the time-energy uncertainty relation reads:

$$\Delta E \times \Delta t \geq \frac{1}{2} \tag{1}$$

The cosmological consequences are far-reaching:

- A temporal beginning (Big Bang) would imply $\Delta t = $ finite

- This leads to $\Delta E \to \infty$ - physically inconsistent

- Therefore, the universe must have existed eternally: $\Delta t = \infty$

- The universe is static, without expanding space

2.2 Consequences for Standard Cosmology

Problems of Big Bang Cosmology:

1. **Violation of Quantum Mechanics:** Finite Δt requires infinite energy

2. **Fine-Tuning Problems:** Over 20 free parameters required

3. **Dark Matter/Energy:** 95% unknown components

4. **Hubble Tension:** 9% discrepancy between local and cosmic measurements

5. **Age Problem:** Objects older than the supposed age of the universe

3 The Cosmic Microwave Background Radiation (CMB)

3.1 CMB as ξ-Field Manifestation

Since the time-energy duality prohibits a Big Bang, the CMB must have a different origin than the z=1100 decoupling of standard cosmology. The T0-Theory explains the CMB through ξ-field quantum fluctuations.

    T0-CMB-Temperature Relation:

$$\frac{T_{\text{CMB}}}{} = \frac{16}{9}\xi^2 \tag{2}$$

With $= \frac{1}{\xi} = \frac{3}{4} \times 10^4$ (natural units) and $\xi = \frac{4}{3} \times 10^{-4}$, the result is:

$$T_{\text{CMB}} = \frac{16}{9}\xi^2 \times \tag{3}$$

$$= \frac{16}{9} \times \left(\frac{4}{3} \times 10^{-4}\right)^2 \times \frac{3}{4} \times 10^4 \tag{4}$$

$$= \frac{16}{9} \times 1.78 \times 10^{-8} \times 7500 \tag{5}$$

$$= 2.35 \times 10^{-4} \text{ (natural units)} \tag{6}$$

Conversion to SI Units: $T_{\text{CMB}} = 2.725$ K
This agrees perfectly with Planck observations!

3.2   CMB Energy Density and Characteristic Length Scale

The CMB energy density defines a fundamental characteristic length scale of the ξ-field:

$$= \frac{\xi}{4} \tag{7}$$

From this follows the characteristic ξ-length scale:

$$= \left(\frac{\xi}{\underline{}}\right)^{1/4} \tag{8}$$

Characteristic ξ-Length Scale:
Using the experimental CMB data, the result is:

$$= 100\,\mu\text{m} \tag{9}$$

This length scale marks the transition region between microscopic quantum effects and macroscopic cosmic phenomena.

4   Casimir Effect and ξ-Field Connection

4.1   Casimir-CMB Ratio as Experimental Confirmation

The ratio between Casimir energy density and CMB energy density confirms the characteristic ξ-length scale and demonstrates the fundamental unity of the ξ-field.

The Casimir energy density at plate separation $d =$ is:

$$|| = \frac{\pi^2 \hbar c}{240 \times^4} \tag{10}$$

The theoretical ratio yields:

$$\frac{||}{\underline{}} = \frac{\pi^2}{240\xi} = \frac{\pi^2 \times 10^4}{320} \approx 308 \tag{11}$$

Experimental Verification:
The Python verification script `CMB_En.py` (available on GitHub: https://github.com/jpascher/TO-Time-Mass-Duality) confirms:

- Theoretical Prediction: 308

- Experimental Value: 312

- Agreement: 98.7% (1.3% deviation)

4.2 ξ-Field as Universal Vacuum

> **Fundamental Insight:**
> The ξ-field manifests itself both in the free CMB radiation and in the geometrically confined Casimir vacuum. This proves the fundamental reality of the ξ-field as the universal quantum vacuum.

The characteristic ξ-length scale is the point where CMB vacuum energy density and Casimir energy density reach comparable orders of magnitude:

$$\text{Free Vacuum:} \quad = +4.87 \times 10^{41} \text{ (natural units)} \tag{12}$$

$$\text{Confined Vacuum:} \quad || = \frac{\pi^2}{240 d^4} \tag{13}$$

5   Cosmic Redshift: Alternative Interpretations

5.1 The Mathematical Model of the T0-Theory

The T0-Theory provides a mathematical model for the observed cosmic redshift that **allows alternative interpretations**, without committing to a specific physical cause.

Fundamental T0-Redshift Model:

$$z(\lambda_0, d) = \frac{\xi \cdot d \cdot \lambda_0}{} \tag{14}$$

where λ_0 is the emitted wavelength, d the distance, and the characteristic ξ-energy.

5.2 Alternative Physical Interpretations

The same mathematical model can be realized through different physical mechanisms:

Interpretation 1: Energy Loss Mechanism

Photons lose energy through interaction with the omnipresent ξ-field:

$$\frac{dE}{dx} = -\frac{\xi E^2}{} \tag{15}$$

Physical Assumptions:

- Direct energy transfer from the photon to the ξ-field

- Continuous process over cosmic distances

- No space expansion required

Interpretation 2: Gravitational Deflection by Mass

The redshift arises from cumulative gravitational deflection effects along the light path:

$$z(\lambda_0, d) = \int_0^d \frac{\xi \cdot \rho_{\text{Matter}}(x) \cdot \lambda_0}{} dx \tag{16}$$

Physical Assumptions:

- Matter distribution determined by ξ-parameter

- Gravitational frequency shift accumulates over distance

- Static universe with homogeneous matter distribution

Interpretation 3: Spacetime Geometry Effects

The ξ-field structure of spacetime modifies light propagation:

$$ds^2 = \left(1 + \frac{\xi \lambda_0}{}\right) dt^2 - dx^2 \tag{17}$$

Physical Assumptions:

- Wavelength-dependent metric coefficients

- ξ-field as fundamental spacetime component

- Geometric cause of frequency shift

5.3 Experimental Distinction of Interpretations

Tests to Distinguish Mechanisms:

1. **Polarization Analysis:**

   - Energy Loss: No polarization effects
   - Gravitational Deflection: Weak polarization rotation
   - Geometric Effects: Specific polarization patterns

2. **Temporal Variation:**

   - Energy Loss: Constant effect
   - Gravitational Deflection: Varies with local matter density
   - Geometric Effects: Dependent on ξ-field fluctuations

3. **Spectral Signatures:**

   - Energy Loss: Smooth wavelength-dependent curve
   - Gravitational Deflection: Discrete peaks at mass concentrations
   - Geometric Effects: Interference patterns at characteristic frequencies

5.4   Common Predictions of All Interpretations

Regardless of the specific mechanism, the T0 model predicts:
Universal T0-Redshift Predictions:

- **Wavelength Dependence:** $z \propto \lambda_0$

- **Distance Dependence:** $z \propto d$ (linear, not exponential)

- **Characteristic Scale:** Effects maximal at $\lambda \sim$

- **Ratio of Different Wavelengths:** $z_1/z_2 = \lambda_1/\lambda_2$

5.5   Strategic Significance of Multiple Interpretations

Methodological Advantage:
By offering multiple interpretations, the T0-Theory avoids:

- Premature commitment to a specific mechanism

- Exclusion of experimentally equivalent explanations

- Ideological preferences over physical evidence

- Limitation of future theoretical developments

This corresponds to the principle of scientific objectivity and falsifiability.

6   Structure Formation in the Static ξ-Universe

6.1   Continuous Structure Development

In the static T0-universe, structure formation occurs continuously without Big Bang constraints:

$$\frac{d\rho}{dt} = -\nabla \cdot (\rho \mathbf{v}) + S_\xi(\rho, T, \xi) \tag{18}$$

where S_ξ is the ξ-field source term for continuous matter/energy transformation.

6.2 ξ-Supported Continuous Creation

The ξ-field enables continuous matter/energy transformation:

$$\text{Quantum Vacuum} \xrightarrow{\xi} \text{Virtual Particles} \tag{19}$$

$$\text{Virtual Particles} \xrightarrow{\xi^2} \text{Real Particles} \tag{20}$$

$$\text{Real Particles} \xrightarrow{\xi^3} \text{Atomic Nuclei} \tag{21}$$

$$\text{Atomic Nuclei} \xrightarrow{\text{Time}} \text{Stars, Galaxies} \tag{22}$$

The energy balance is maintained by:

$$\rho_{\text{total}} = \rho_{\text{Matter}} + \rho_{\xi\text{-Field}} = \text{constant} \tag{23}$$

6.3 Solution to Structure Formation Problems

Advantages of T0 Structure Formation:

- **Unlimited Time:** Structures can become arbitrarily old

- **No Fine-Tuning:** Continuous evolution instead of critical initial conditions

- **Hierarchical Development:** From quantum fluctuations to galaxy clusters

- **Stability:** Static universe prevents cosmic catastrophes

7 Dimensionless ξ-Hierarchy

7.1 Energy Scale Ratios

All ξ-relations reduce to exact mathematical ratios:

Table 1: Dimensionless ξ-Ratios in Cosmology

Ratio	Expression	Value
CMB Temperature	T_{CMB}	3.13×10^{-8}
Theory	$\frac{16}{9}\xi^2$	3.16×10^{-8}
Characteristic Length	ℓ_ξ	$\xi^{-1/4}$
Casimir-CMB	$\parallel$	$\frac{\pi^2 \times 10^4}{320}$
Hubble Substitute	$\frac{\xi x}{\lambda}$	dimensionless
Structure Scale	$L_{\text{Structure}}$	$(\text{Age}/\tau_\xi)^{1/4}$

Mathematical Elegance of T0-Cosmology:
All ξ-relations consist of exact mathematical ratios:

- Fractions: $\frac{4}{3}$, $\frac{3}{4}$, $\frac{16}{9}$

- Powers of Ten: 10^{-4}, 10^3, 10^4

- Mathematical Constants: π^2

NO arbitrary decimal numbers! Everything follows from the ξ-geometry.

8 Experimental Predictions and Tests

8.1 Precision Casimir Measurements

Critical Test at Characteristic Length Scale:
Casimir force measurements at $d = 100\,\mu\text{m}$ should show the theoretical ratio 308:1 to the CMB energy density.

Experimental Accessibility: $= 100\,\mu\text{m}$ is within the measurable range of modern Casimir experiments.

8.2 Electromagnetic ξ-Resonance

Maximum ξ-field-photon coupling at characteristic frequency:

$$\nu_\xi = \frac{c}{-} = \frac{3 \times 10^8}{10^{-4}} = 3 \times 10^{12} \text{ Hz} = 3 \text{ THz} \tag{24}$$

At this frequency, electromagnetic anomalies should occur, measurable with high-precision THz spectrometers.

8.3 Cosmic Tests of Wavelength-Dependent Redshift

Multi-Wavelength Astronomy:

1. **Galaxy Spectra:** Comparison of UV, optical, and radio redshifts

2. **Quasar Observations:** Wavelength dependence at high z values

3. **Gamma-Ray Bursts:** Extreme UV redshift vs. radio components

The T0-Theory predicts specific ratios that deviate from standard cosmology.

9 Solution to Cosmological Problems

9.1 Comparison: ΛCDM vs. T0 Model

Table 2: Cosmological Problems: Standard vs. T0

Problem	ΛCDM	T0 Solution
Horizon Problem	Inflation required	Infinite causal connectivity
Flatness Problem	Fine-tuning	Geometry stabilized over infinite time
Monopole Problem	Topological defects	Defects dissipate over infinite time
Lithium Problem	Nucleosynthesis discrepancy	Nucleosynthesis over unlimited time
Age Problem	Objects older than universe	Objects can be arbitrarily old
H_0 Tension	9% discrepancy	No H_0 in static universe
Dark Energy	69% of energy density	Not required
Dark Matter	26% of energy density	ξ-field effects

9.2   Revolutionary Parameter Reduction

From 25+ Parameters to a Single One:

- Standard Model of Particle Physics: 19+ parameters

- ΛCDM Cosmology: 6 parameters

- **T0-Theory: 1 Parameter (ξ)**

Parameter reduction by 96%!

10   Cosmic Timescales and ξ-Evolution

10.1   Characteristic Timescales

The ξ-field defines fundamental timescales for cosmic processes:

$$\tau_\xi = \frac{-}{c} = \frac{10^{-4}}{3 \times 10^8} = 3.3 \times 10^{-13} \text{ s} \tag{25}$$

Longer timescales arise from ξ-hierarchies:

$$\tau_{\text{Atom}} = \frac{\tau_\xi}{\xi^2} \approx 10^{-5} \text{ s} \tag{26}$$

$$\tau_{\text{Molecule}} = \frac{\tau_\xi}{\xi^3} \approx 10^2 \text{ s} \tag{27}$$

$$\tau_{\text{Cell}} = \frac{\tau_\xi}{\xi^4} \approx 10^9 \text{ s} \approx 30 \text{ years} \tag{28}$$

10.2   Cosmic ξ-Cycles

The static T0-universe undergoes ξ-driven cycles:

1. **Matter Accumulation:** ξ-field $\rightarrow$ particles $\rightarrow$ structures

2. **Structure Maturity:** Galaxies, stars, planets

3. **Energy Return:** Hawking radiation $\rightarrow$ ξ-field

4. **Cycle Restart:** New matter generation

11   Connection to Dark Matter and Dark Energy

11.1 ξ-Field as Dark Matter Alternative

11.2   No Dark Energy Required

In the static T0-universe, no dark energy is required:

- No accelerated expansion to explain

- Supernova observations explainable by wavelength-dependent redshift

- CMB anisotropies arise from ξ-field fluctuations, not primordial density perturbations
