One idea — geometric, algebraic, field-theoretic.

Volume 2 deepens the foundations of Volume 1 mathematically. It develops the Lagrangian formalism of the theory along several routes, eliminates mass from the Dirac equation and establishes the connection to quantum field theory and quantum mechanics.

The time–mass duality $\tilde{T} \cdot m = 1$ is derived universally, formulated in terms of energy and carried through complete calculations up to particle masses and physical constants — including the full particle spectrum and the extended analysis of the Bell tests.

Repetition is intended: every concept appears from a different angle and with greater mathematical depth.

Johann Pascher

Johann Pascher is an independent theoretical physicist and author of FFGFT / T0 theory. In more than 300 documents he develops a geometric framework that derives the fundamental constants of physics from a single dimensionless parameter ξ. All work is openly accessible.
