

# One number. Every lepton mass.

The path there is told from the ground up. A four-dimensional torus instead of an equation as the starting point. A single dimensionless parameter,  $\xi = 4/30\,000$ , from which the masses follow as powers, not as fitted values. Then the step from the closed torus to the space and time we observe — and finally the icosahedron, whose angle  $2/9$  closes a forty-year-old open question.

Written for readers who want the argument rather than the formalism: the derivations and verification scripts stay in the FFGFT corpus, the reasoning stays in the text. Every claim is marked for what it is — proven, numerically confirmed, or posited.
