Abstract

The T0 model describes a fundamental granulation of spacetime at the sub-Planck scale $\ell_0 = \xi \times \ell_P$ with $\xi \approx 1.333 \times 10^{-4}$. This work examines the consequences for scale hierarchies, time continuity, and the mathematical completeness of various gravitational theories. The time-mass duality $T(x, t) \cdot m(x, t) = 1$ requires both fields to be coupled and variable, while the fundamental ξ -asymmetry enables all developmental processes.

Note on the corpus status: variable speed of light. The idea of a varying speed of light referred to in this document has been replaced in the later corpus by *fractal path lengthening*: the geometric stretching of the propagation path in the ξ field (Doc. 026, 149, 182; achromatic according to K6 in Doc. 190). Statements that rely on a variable speed of light are to be read accordingly.

.1 Granulation as Fundamental Principle of Reality

Minimum Length Scale ℓ_0

The T0 model introduces a fundamental length scale deeper than the Planck length:

$$\ell_0 = \xi \times \ell_P \approx \frac{4}{3} \times 10^{-4} \times 1.616 \times 10^{-35} \text{ m} \approx 2.155 \times 10^{-39} \text{ m} \quad (1)$$

Significance of ℓ_0 :

- Absolute physical lower limit for spatial structures
- Granulated spacetime structure - not continuous

- Sub-Planck physics with new fundamental laws
- Universal scale for all physical phenomena

The Extreme Scale Hierarchy

From ℓ_0 to cosmological scales extends a hierarchy of over 60 orders of magnitude:

$$\ell_0 \approx 10^{-39} \text{ m} \quad (\text{Sub-Planck minimum}) \quad (2)$$

$$\ell_P \approx 10^{-35} \text{ m} \quad (\text{Planck length}) \quad (3)$$

$$L_{\text{Casimir}} \approx 100 \text{ micrometers} \quad (\text{Casimir scale}) \quad (4)$$

$$L_{\text{Atom}} \approx 10^{-10} \text{ m} \quad (\text{Atomic scale}) \quad (5)$$

$$L_{\text{Macro}} \approx 1 \text{ m} \quad (\text{Human scale}) \quad (6)$$

$$L_{\text{Cosmo}} \approx 10^{26} \text{ m} \quad (\text{Cosmological scale}) \quad (7)$$

Casimir Scale as Evidence of Granulation

At the Casimir characteristic scale, first measurable effects appear:

$$L_\xi \approx \frac{1}{\sqrt{\xi} \times \ell_P} \approx 100 \text{ micrometers} \quad (8)$$

Experimental evidence:

- Deviations from $1/d^4$ law at distances $\approx 10 \text{ nm}$
- ξ -corrections in Casimir force measurements
- Limits of continuum physics become visible

.2 Limit Systems and Scale Hierarchies

Three-Scale Hierarchy

The T0 model organizes all physical scales into three fundamental domains:

1. **ℓ_0 -domain:** Granulated physics, universal laws
2. **Planck domain:** Quantum gravity, transition dynamics
3. **Macro domain:** Classical physics with ξ -corrections

Relational Number System

Prime number ratios organize particles into natural generations:

- **3-limit:** u-, d-quarks (1st generation)
- **5-limit:** c-, s-quarks (2nd generation)
- **7-limit:** t-, b-quarks (3rd generation)

The next prime number (11) leads to ξ^{11} -corrections $\approx 10^{-44}$, which lie below the Planck scale.

CP Violation from Universal Asymmetry

The ξ -asymmetry explains:

- CP violation in weak interactions
- Matter-antimatter asymmetry in the universe
- Chiral symmetry breaking in nature

.3 Fundamental Asymmetry as Motion Principle

The Universal ξ -Constant

$$\xi = \frac{4}{3} \times 10^{-4} \approx 1.333 \times 10^{-4} \quad (9)$$

Origin: Geometric 4/3-constant from optimal 3D space packing

Effect: Universal asymmetry enabling all development

Eternal Universe Without Big Bang

The T0 model describes an eternal, infinite, non-expanding universe:

- No beginning, no end - timeless existence
- Heisenberg's uncertainty principle forbids a classical Big Bang singularity with infinite density: $\Delta E \times \Delta t \geq \hbar/2$; instead, a tiny but finite core with minimal length scale L_0 (from ξ) remains.
- Structured development instead of chaotic explosion
- Continuous ξ -field dynamics instead of Big Bang

Time Exists Only After Field-Asymmetry Excitation

Hierarchy of time emergence:

1. **Timeless universe:** Perfect symmetry, no time
2. **ξ -asymmetry arises:** Symmetry breaking activates time field
3. **Time-energy duality:** $T(x, t) \cdot E(x, t) = 1$ becomes active
4. **Manifested time:** Local time emerges through field dynamics
5. **Directed time:** Thermodynamic arrow of time stabilizes
Time is not fundamental but emergent from field asymmetry.

.4 Hierarchical Structure: Universe > Field > Space

The Fundamental Order Hierarchy

Universe (highest order level):

- Superordinate structure with eternal, infinite properties
- Global organizational principles determine everything below
- ξ -asymmetry as universal guiding structure
- Thermodynamic overall balance of all processes

Field (middle organizational level):

- Universal ξ -field as mediator between universe and space
- Local dynamics within global constraints
- Time-energy duality as field principle
- Structure-forming processes through asymmetry

Space (manifestation level):

- 3D geometry as stage for field manifestations
- Granulation at ℓ_0 -scale
- Local interactions between field excitations

Causal Downward Coupling

$$\text{UNIVERSE} \rightarrow \text{FIELD} \rightarrow \text{SPACE} \rightarrow \text{PARTICLES} \quad (10)$$

The universe is not just the sum of its spatial parts. Superordinate properties emerge only at the highest level. The ξ -constant is universal, not a space property.

.5 Continuous Time Beyond Certain Scales

The Crucial Scale Hierarchy of Time

In the T0 model, different time domains exist with fundamentally different properties. The further we move from ℓ_0 , the more continuous and constant time becomes.

Granulated Zone (below ℓ_0)

$$\ell_0 = \xi \times \ell_P \approx 2.155 \times 10^{-39} \text{ m} \quad (11)$$

- Time is discretely granulated, not continuous
- Chaotic quantum fluctuations dominate
- Physics loses classical meaning
- All fundamental forces equally strong

Transition Zone (around ℓ_0)

- Time-mass duality $T \cdot m = 1$ becomes fully active
- Intensive interaction of all fields
- Transition from granulated to continuous

Continuous Zone (above ℓ_0)

Central Insight

$$\text{Distance to } \ell_0 \uparrow \Rightarrow \text{Time continuity } \uparrow \Rightarrow \text{Constant direction } \uparrow \quad (12)$$

- Beyond a certain point, time becomes continuous
- Constant directed flow direction emerges
- The greater the distance to ℓ_0 , the more stable the time direction
- Emergent classical physics with ξ -corrections

Quantitative Scaling of Time Continuity

Time continuity as function of distance to ℓ_0 :

$$\text{Time continuity} \propto \log\left(\frac{L}{\ell_0}\right) \quad \text{for } L \gg \ell_0 \quad (13)$$

Practical scales:

$$L = 10^{-35} \text{ m (Planck)} : \text{ Still granulated} \quad (14)$$

$$L = 10^{-15} \text{ m (Nuclear)} : \text{ Transition to continuity} \quad (15)$$

$$L = 10^{-10} \text{ m (Atomic)} : \text{ Practically continuous} \quad (16)$$

$$L = 10^{-3} \text{ m (mm)} : \text{ Completely continuous, constant direction} \quad (17)$$

$$L = 1 \text{ m (Meter)} : \text{ Perfectly linear, directed time} \quad (18)$$

Thermodynamic Arrow of Time

Scale-dependent entropy:

- **Granulated level (ℓ_0):** Maximum entropy, perfect symmetry
- **Transition level:** Entropy gradients emerge
- **Continuous level:** Second law becomes active
- **Macroscopic level:** Irreversible time direction

.6 Practical vs. Fundamental Physics

Time is Practically Experienced as Constant

De facto for us: Time flows constantly in our experience domain

- **Local scales (m to km):** Time is practically perfectly linear and constant
- **Measurable variations:** Only under extreme conditions (GPS satellites, particle accelerators)
- **Everyday physics:** Time constancy is a good approximation

Speed of Light as Clear Upper Limit

Observed reality:

- $c = 299,792,458 \text{ m/s}$ is measurable upper limit for information transfer
- **Causality:** No signals faster than c observed
- **Relativistic effects:** Clearly measurable at $v \rightarrow c$
- **Particle accelerators:** Confirm c -limit daily

Resolution of the Apparent Contradiction

Macroscopic level (our world):

$$L = 1 \text{ m to } 10^6 \text{ m (km range)} \quad (19)$$

- Time flows constantly: $dt/dt_0 \approx 1 + 10^{-16}$ (immeasurable)

- c is practically constant: $\Delta c/c \approx 10^{-16}$ (immeasurable)
- Einstein physics works perfectly

Fundamental level (T0 model):

$$\ell_0 = 10^{-39} \text{ m to } \ell_P = 10^{-35} \text{ m} \quad (20)$$

- Time-mass duality: $T \cdot m = 1$ is fundamental
 - c is ratio: $c = L/T$ (must be variable)
 - Mathematical consistency requires coupled variation
- These variations are 10^6 times smaller than our best measurement precision!**

.7 Gravitation: Mass Variation vs. Space Curvature

Two Equivalent Interpretations

Einstein interpretation:

- $m = \text{constant}$ (fixed mass)
- $g_{\mu\nu} = \text{variable}$ (curved spacetime)
- Mass causes space curvature

T0 interpretation:

- $m(x, t) = \text{variable}$ (dynamic mass)
- $g_{\mu\nu} = \text{fixed}$ (flat Euclidean space)
- Mass varies locally through ξ -field

Important Insight: We Don't Know!

Attention - Fundamental Point

We DO NOT KNOW whether mass causes space curvature or whether mass itself varies!

This is an assumption, not a proven fact!

Both interpretations are equally valid:

Einstein assumption:

$$\text{Mass/energy} \rightarrow \text{Space curvature} \rightarrow \text{Gravitation} \quad (21)$$

$$G_{\mu\nu} = 8\pi T_{\mu\nu} \quad (22)$$

T0 alternative:

$$\xi\text{-field} \rightarrow \text{Mass variation} \rightarrow \text{Gravitational effects} \quad (23)$$

$$m(x, t) = m_0 \cdot (1 + \xi \cdot \Phi(x, t)) \quad (24)$$

Experimental Indistinguishability

All measurements are frequency-based:

- **Clocks:** Hyperfine transition frequencies
- **Scales:** Spring oscillations/resonance frequencies

- **Spectrometers:** Light frequencies and transitions
- **Interferometers:** Phases = frequency integrals
- **Identical frequency shifts:**

$$\text{Einstein : } \nu' = \nu_0 \sqrt{1 + 2\Phi/c^2} \approx \nu_0(1 + \Phi/c^2) \quad (25)$$

$$\text{T0 : } \nu' = \nu_0 \cdot \frac{m(x,t)}{T(x,t)} \approx \nu_0(1 + \Phi/c^2) \quad (26)$$

Only frequency ratios are measurable - absolute frequencies are fundamentally inaccessible!

.8 Mathematical Completeness: Both Fields Coupled Variable

The Correct Mathematical Formulation

Mathematically correct in T0 model:

$$T(x,t) = \text{variable} \quad (\text{Time as dynamic field}) \quad (27)$$

$$m(x,t) = \text{variable} \quad (\text{Mass as dynamic field}) \quad (28)$$

Coupled through fundamental duality:

$$T(x,t) \cdot m(x,t) = 1 \quad (29)$$

Both fields vary TOGETHER:

$$T(x,t) = T_0 \cdot (1 + \xi \cdot \Phi(x,t)) \quad (30)$$

$$m(x,t) = m_0 \cdot (1 - \xi \cdot \Phi(x,t)) \quad (31)$$

Verification of Mathematical Consistency

Duality check:

$$T(x,t) \cdot m(x,t) = T_0 m_0 \cdot (1 + \xi \Phi)(1 - \xi \Phi) \quad (32)$$

$$= T_0 m_0 \cdot (1 - \xi^2 \Phi^2) \quad (33)$$

$$\approx T_0 m_0 = 1 \quad (\text{for } \xi \Phi \ll 1) \quad (34)$$

Mathematical consistency confirmed!

Why Both Fields Must Be Variable

Lagrange formalism requires:

$$\delta S = \int \delta \mathcal{L} d^4x = 0 \quad (35)$$

Complete variation:

$$\delta \mathcal{L} = \frac{\partial \mathcal{L}}{\partial T} \delta T + \frac{\partial \mathcal{L}}{\partial m} \delta m + \frac{\partial \mathcal{L}}{\partial \partial_\mu T} \delta \partial_\mu T + \frac{\partial \mathcal{L}}{\partial \partial_\mu m} \delta \partial_\mu m \quad (36)$$

For mathematical completeness:

- $\delta T \neq 0$ (Time must be variable)
- $\delta m \neq 0$ (Mass must be variable)
- Both coupled through $T \cdot m = 1$

Einstein's Arbitrary Constant Setting

Einstein arbitrarily sets:

$$m_0 = \text{constant} \Rightarrow \delta m = 0 \quad (37)$$

Mathematical problem:

- Incomplete variation of the Lagrangian
- Violates variation principle of field theory
- Arbitrary symmetry breaking without justification

Parameter Elegance

$$\text{Einstein : } m_0, c, G, \hbar, \Lambda, \alpha_{\text{EM}}, \dots \quad (>> 10 \text{ free parameters}) \quad (38)$$

$$\text{T0 : } \xi \quad (1 \text{ universal parameter}) \quad (39)$$

.9 Pragmatic Preference: Variable Mass with Constant Time

The Pragmatic Alternative for Our Experience Space

As pragmatists, one can certainly prefer:

$$\text{Time : } t = \text{constant} \quad (\text{practical experience}) \quad (40)$$

$$\text{Mass : } m(x, t) = \text{variable} \quad (\text{dynamic adjustment}) \quad (41)$$

Why this is pragmatically sensible:

- Time constancy corresponds to our direct experience
- Mass variation is conceptually easier to imagine
- Practical calculations often become simpler
- Intuitive understandability for applications

Practical Advantages of Constant Time

In our experienceable space (m to km):

- Time flows linearly and constantly - our direct experience
- Clocks tick uniformly - practical time measurement
- Causal sequences are clearly defined
- Technical applications (GPS, navigation) function

Language convention:

- Time passes constantly
- Mass adapts to the fields
- Matter becomes heavier/lighter depending on location

Variable Mass as Intuitive Concept

Pragmatic interpretation:

$$m(x) = m_0 \cdot (1 + \xi \cdot \text{Gravitational field}(x)) \quad (42)$$

Intuitive conception:

- Mass increases in strong gravitational fields
- Mass decreases in weaker fields
- Matter feels the local ξ -field
- Dynamic adaptation to environment

Scientific Legitimacy of Preference

Important Insight

Pragmatic preferences are scientifically justified when both approaches are experimentally equivalent!

Justification:

- Scientifically equivalent to Einstein approach
- Often practically advantageous for applications
- Didactically easier to teach
- Technically more efficient to implement

The choice between constant time + variable mass vs. Einstein is a matter of taste - both are scientifically equally justified!

.10 The Eternal Philosophical Boundary

What the T0 Model Explains

- HOW the ξ -asymmetry works
- WHAT the consequences are
- WHICH laws follow from it
- WHEN time and development emerge

What the T0 Model CANNOT Explain

The fundamental questions remain:

- WHY does the ξ -asymmetry exist?
- WHERE does the original energy come from?
- WHO/WHAT gave the first impulse?
- WHY does anything exist at all instead of nothing?

Scientific Humility

The eternal boundary: Every explanation needs unexplained axioms. The ultimate reason always remains mysterious. The that of existence is given, the why remains open.

The elegant shift: The T0 model shifts the mystery to a deeper, more elegant level - but it cannot resolve the fundamental riddle of existence.

And that is good. Because a universe without mystery would be a boring universe.

.11 Experimental Predictions and Tests

Casimir Effect Modifications

- Deviations from $1/d^4$ law at $d \approx 10$ nm
- ξ -corrections in precision measurements
- Frequency-dependent Casimir forces

Atom Interferometry

- ξ -resonances in quantum interferometers
- Mass variations in gravitational fields
- Time-mass duality in precision experiments

Gravitational Wave Detection

- ξ -corrections in LIGO/Virgo data
- Modifications of wave dispersion
- Sub-Planck structures in gravitational waves

.12 Mathematical Proof: The Formula $T \cdot m = 1$ Excludes Singularities

Important Clarification: T as Oscillation Period

ATTENTION: In this analysis, T does not mean the experienced, continuously flowing time, but the **oscillation period** or **characteristic time constant** of a system. This is a fundamental difference:

- T = oscillation period (discrete, characteristic time unit)
- Not: T = continuous time coordinate (our everyday experience)

The Fundamental Exclusion Property

The equation $T \cdot m = 1$ is not just a mathematical relationship – it is an **exclusion theorem**. Through its algebraic structure, it makes certain states mathematically impossible.

Proof 1: Exclusion of Infinite Mass

Assumption: There exists an infinite mass $m = \infty$

Mathematical consequence:

$$T \cdot m = 1 \quad (43)$$

$$T \cdot \infty = 1 \quad (44)$$

$$T = \frac{1}{\infty} = 0 \quad (45)$$

Contradiction: $T = 0$ is not in the domain of the equation $T \cdot m = 1$, since:

- The product $0 \cdot \infty$ is mathematically undefined
- The original equation $T \cdot m = 1$ would be violated ($0 \cdot \infty \neq 1$)

Conclusion: $m = \infty$ is excluded by the formula.

Proof 2: Exclusion of Infinite Time

Assumption: There exists an infinite time $T = \infty$

Mathematical consequence:

$$T \cdot m = 1 \quad (46)$$

$$\infty \cdot m = 1 \quad (47)$$

$$m = \frac{1}{\infty} = 0 \quad (48)$$

Contradiction: $m = 0$ is not in the domain, since:

- The product $\infty \cdot 0$ is mathematically undefined
- The equation $T \cdot m = 1$ would be violated ($\infty \cdot 0 \neq 1$)

Conclusion: $T = \infty$ is excluded by the formula.

Proof 3: Exclusion of Zero Values

Assumption: There exists $T = 0$ or $m = 0$

Case 1: $T = 0$

$$T \cdot m = 1 \Rightarrow 0 \cdot m = 1 \quad (49)$$

This is impossible for any finite value of m , since $0 \cdot m = 0 \neq 1$.

Case 2: $m = 0$

$$T \cdot m = 1 \Rightarrow T \cdot 0 = 1 \quad (50)$$

This is impossible for any finite value of T , since $T \cdot 0 = 0 \neq 1$.

Conclusion: Both $T = 0$ and $m = 0$ are excluded by the formula.

Proof 4: Exclusion of Mathematical Singularities

Definition of a singularity: A point where a function becomes undefined or infinite.

Analysis of the function $T = \frac{1}{m}$:

Potential singularities could occur at:

- $m = 0$ (division by zero)
- $T \rightarrow \infty$ (infinite function values)

Exclusion by the constraint $T \cdot m = 1$:

1. **At $m = 0$:** The equation $T \cdot m = 1$ cannot be satisfied
2. **At $T \rightarrow \infty$:** Would require $m \rightarrow 0$, which is already excluded

Mathematical proof of singularity freedom:

For every point (T, m) with $T \cdot m = 1$:

$$T = \frac{1}{m} \text{ with } m \in (0, +\infty) \quad (51)$$

$$m = \frac{1}{T} \text{ with } T \in (0, +\infty) \quad (52)$$

Both functions are on their entire domain:

- **Continuous**
- **Differentiable**
- **Finite Well-defined**

The Algebraic Protection Function

The equation $T \cdot m = 1$ acts like an **algebraic protection** against singularities:

Automatic Correction

If m becomes very small $\Rightarrow T$ automatically becomes very large (53)

If T becomes very small $\Rightarrow m$ automatically becomes very large (54)

But: $T \cdot m$ always remains exactly 1 (55)

Mathematical Stability

$\lim_{m \rightarrow 0^+} T = +\infty$, but $T \cdot m = 1$ remains satisfied (56)

$\lim_{T \rightarrow 0^+} m = +\infty$, but $T \cdot m = 1$ remains satisfied (57)

The constraint **forces** the variables into a finite, well-defined region.

Proof 5: Positive Definiteness

Theorem: All solutions of $T \cdot m = 1$ are positive.

Proof:

$$T \cdot m = 1 > 0 \quad (58)$$

Since the product is positive, both factors must have the same sign.

Exclusion of negative values:

- If $T < 0$ and $m < 0$, then $T \cdot m > 0$, but physically meaningless
- If $T > 0$ and $m < 0$, then $T \cdot m < 0 \neq 1$
- If $T < 0$ and $m > 0$, then $T \cdot m < 0 \neq 1$

Conclusion: Only $T > 0$ and $m > 0$ satisfy the equation.

The Fundamental Insight About Time and Continuity

Important physical clarification:

The formula $T \cdot m = 1$ describes **discrete, characteristic properties** of systems, not the continuous time flow of our experience. This means:

What $T \cdot m = 1$ does NOT state:

- „Time stands still“ ($T = 0$)
- „Processes take infinitely long“ ($T = \infty$)
- „The time flow is interrupted“
- „Our experienced time disappears“

What $T \cdot m = 1$ actually describes:

- **Oscillation periods** have mathematical limits
- **Characteristic time constants** cannot become arbitrary
- **Discrete time units** stand in fixed relation to mass
- **Periodic processes** follow the constraint $T \cdot m = 1$

The continuous time flow remains unaffected

The continuous time coordinate t (our „arrow time“) is **not affected** by this relationship. $T \cdot m = 1$ regulates only the **intrinsic time scales** of physical systems, not the superordinate time flow in which these systems exist.

Important insight about our time perception:

Our continuous time perception could practically be only a **tiny excerpt** of a much larger period – an oscillation period so immense that it far exceeds anything humans could ever experience or conceive.

Conceivable orders of magnitude:

- **Human life:** $\sim 10^2$ years
- **Human history:** $\sim 10^4$ years
- **Earth age:** $\sim 10^9$ years
- **Universe age:** $\sim 10^{10}$ years **Possible cosmic period:** 10^{50} , 10^{100} or even larger time scales

In such a scenario, our entire observable universe would experience only an **infinitesimal small fraction** of a fundamental oscillation period. For us, time appears linear and continuous because we perceive only a vanishingly small section of a huge cosmic „oscillation“.

Analogy: Just as a bacterium on a clock hand would perceive the movement as „straight ahead“, although it moves on a circular path, we might experience „linear time“, although we are in a gigantic periodic structure.

This perspective shows that $T \cdot m = 1$ and our time perception can operate on completely different scales without contradicting each other.

Cosmological Implications**This viewpoint opens new possibilities:**

What we observe as cosmic development and change could be only a **small section** in a much larger cyclic pattern that follows the fundamental relationship $T \cdot m = 1$.

Possible cosmic structure:

- **Local time perception:** Linear, continuous (our experience domain)
- **Middle time scales:** Observable cosmic developments
- **Fundamental time scale:** Gigantic period according to $T \cdot m = 1$

Implications:

- Nature could be organized in **layered-periodic** fashion
- Different time scales follow different regularities
- $T \cdot m = 1$ could be the **master constraint** for the largest scale
- Our observable cosmic development would be a fragment of a cyclic system

This interpretation shows how mathematical constraints ($T \cdot m = 1$) and physical observations (linear time perception) can coexist in a **hierarchical time model**.
