How does the compact T^4 become the observed world?

Volume 6 covers Docs. 263 to 310. It opens with the holographic principle in its fractal reading, the cosmological degeneracy between ΛCDM and FFGFT, and the CMB peak ratios derived from T^4.

Next comes the projection chain from T^4 to observation space, up to the computed bridge to the Helix–Light–Vortex approach. The dynamical sector separates modulus and phase in the four fermion sectors and shows the twofold origin of the angle **θ = 2/9**.

Time and information form the fourth part: time as a logarithmic spiral, information as an output rather than a basic unit, and the native time–energy reciprocity.

Johann Pascher

Johann Pascher is an independent theoretical physicist and author of FFGFT / T0 theory. In more than 300 documents he develops a geometric framework that derives the fundamental constants of physics from a single dimensionless parameter ξ. All work is openly accessible.
