Correction notes

Corrections from the calculation review (30 Sept. 2026). The following places are corrected or annotated in the text; each carries a dated note there with the previous value:

- Table, sub-Planck factor row: $f = 1/(4\xi) \rightarrow f = 1/\xi$ ($1/(4\xi)$ would give 1875).
- Anomalous magnetic moments: $a_\tau = f^{1/3} - 1 \approx 1.282 \times 10^{-3} \rightarrow \text{ratio } \Delta a_{\tau-\mu}/\Delta a_{\mu-e} = f^{1/3} - 1 \approx 18.57$ with the tau value $a_\tau \approx 1.282 \times 10^{-3}$ that follows from it.
- Higgs VEV in table and equation: $E_P/(f^2\sqrt{4\pi})$ (gives 6.1×10^{10} GeV) $\rightarrow E_P/(f^4 \cdot (\pi/2) \cdot 10)$ (already corrected in the text on 29 Sept. 2026), see Doc. 383.
- Calculation check, further points: $N(f) \propto f^{3-\xi} \approx f^3 \cdot 0.9867 \rightarrow f^3 \cdot 0.99881$; modified Coulomb law $1/r^{1+\xi} \rightarrow 1/r^{2-\xi} \approx r^{-2}(1 + \xi \ln r)$; notes on $30000 = 3 \times 4 \times 1000$ (gives 12000) and on $D_{\text{eff}} \approx 3 - \xi$ (correct: ≈ 4).
- (2 Oct. 2026) Factor 10 in ν : fitted to the measured value, not motivated; with the bare ν of the ladder $10 K_{\text{frak}} \approx \pi^2$ (Doc. 387).

Abstract

This analysis investigates the compatibility of the dimensional descriptions in three central T0 documents: the 4-dimensional torsion crystal formulation (Documents 149 and 018) and the fractal dimension formulation $D_f = 3 - \xi$ (Document 145). The central question is: Are these descriptions contradictory or complementary? The analysis shows: **The formulations are fully compatible** and describe the same physical phenomenon from two complementary perspectives – a geometric-topological one (4D torsion crystal) and a fractal-analytical one (effective dimension). The fundamental parameter $\xi = 4/30000 = 1.333 \times 10^{-4}$ unifies both views: topologically, the 4 encodes the number of fundamental dimensions, while fractally, the factor 4/3 describes the sphere packing geometry. Both lead to identical experimental predictions.

.1 Introduction: The Problem Statement

Initial Situation

In T0 theory (FFGFT – Fundamental Fractal Geometric Field Theory), several documents exist that seemingly use different dimensional descriptions of the fundamental spacetime structure:

- **Document 149** (149_FFGFT-torsion_De.pdf): Describes a “four-dimensional gyral torus”
- **Document 018** (018_T0-Anomale-g2-10_De.pdf): Uses a “4-dimensional torsion lattice”
- **Document 145** (145_FFGFT_donat-teil1_De.pdf): Defines a “fractal dimension $D_f = 3 - \xi$ ”

Central Question

Core Question of the Analysis

Are the 4-dimensional formulation (Documents 149, 018) and the fractal dimension formulation $D_f = 3 - \xi$ (Document 145) compatible with each other, or do they describe contradictory physical models?

Main Result

Central Answer

YES – The formulations are fully compatible.

They describe the same physical phenomenon from two complementary perspectives:

- **Geometric Perspective** (149, 018): 4D torsion crystal with compactified 4th dimension
- **Fractal Perspective** (145): Effective dimension $D_f = 3 - \xi$ as a result of compactification

The parameter $\xi = 4/30000$ unifies both views and leads to identical physical predictions.

.2 Document Overview

Document 149: 149_FFGFT-torsion_De.pdf

Dimensional Description

Document 149 explicitly postulates:

*“The universe is a static **4-dimensional** torsion crystal whose discrete sub-Planck structure generates all observable physical phenomena.”*

Key features:

- Four-dimensional gyral torus
- 3 spatial dimensions + 1 compactified extra dimension
- The 4th dimension is “rolled up” and not directly accessible
- Energy distribution over f^4 (four-dimensional hypercube)

Mathematical Structure

The fundamental number 30000 is interpreted as:

$$30000 = 3 \times 4 \times 1000 \quad (1)$$

(Note of 30 Sept. 2026: $3 \times 4 \times 1000 = 12000$, not 30000; the decomposition does not hold in this form.) where:

- 3 = three experienceable spatial dimensions
- 4 = full four-dimensional reality
- 1000 = scale hierarchy between fundamental and observable

It follows that:

$$\xi = \frac{4}{30000} = 1.333\bar{3} \times 10^{-4} \quad (2)$$

Energy Consideration

The Planck energy is distributed over the four-dimensional lattice:

$$E_{\text{higgs}} = \frac{E_P}{f^4} \quad (3)$$

Narrative explanation: In four dimensions, a hypercube of edge length f contains exactly f^4 cells. The energy is distributed uniformly over all these cells.

Document 018: 018_T0_Anomale-g2-10_De.pdf

Dimensional Description

Document 018 uses the identical formulation:

*"T0 theory is based on the principle that **all** physical constants should follow from the geometric structure of a **4-dimensional torsion lattice**."*

Physical Interpretation

Leptons are interpreted as winding structures in the 4D lattice:

- **Electron:** Simple winding (1st generation)
- **Muon:** Winding with fractal branching (2nd generation)
- **Tau:** More complex fractal structure (3rd generation)

The anomalous magnetic moments arise from geometric projections of these windings into 3D space.

Document 145: 145_FFGFT_donat-teil1_De.pdf

Dimensional Description

Document 145 uses a different language:

*"The central starting point of the theory is the description of spacetime through a **fractal dimension** D_f that lies slightly below the topological dimension 3."*

Mathematically:

$$D_f = 3 - \xi, \quad \text{with} \quad \xi = \frac{4}{3} \times 10^{-4} \quad (4)$$

Physical Meaning

Interpretation of the fractal dimension:

- $D_f < 3$ means: Space is not "completely filled"
- A kind of "porosity" or "gappiness" exists
- These gaps account for $\xi \approx 0.0001333$ of the dimensionality

Scaling behavior:

$$N(r) \propto r^{D_f} = r^{3-\xi} \quad (5)$$

When increasing the resolution by factor r , the number of visible structures grows as $r^{(3-\xi)}$ instead of r^3 .

Geometric Origin

The factor $4/3$ in $\xi = (4/3) \times 10^{-4}$ is associated with sphere packing:

- Sphere volume: $V = \frac{4}{3}\pi r^3$
- Densest sphere packing: packing density ≈ 0.74 (~26% gaps)

.3 Mathematical Compatibility

The Dual Meaning of $\xi = 4/30000$

The fundamental parameter ξ carries a deep dual meaning that unifies both perspectives:

Topological Interpretation (Documents 149, 018)

$$\xi = \frac{4}{30000} = \frac{4}{3 \times 4 \times 1000} \quad (6)$$

(Note of 30 Sept. 2026: $4/(3 \times 4 \times 1000) = 4/12000 = 3.33 \times 10^{-4} \neq \xi$; see the note on the decomposition of 30000 above.)

Meaning:

- 4 (numerator) = number of fundamental dimensions
- 3 (denominator) = number of observable dimensions
- 4 (denominator) = repetition of fundamental dimensionality
- 1000 = scale hierarchy

Fractal Interpretation (Document 145)

$$\xi = \frac{4}{3} \times 10^{-4} \quad (7)$$

Meaning:

- $\frac{4}{3}$ = geometric factor (sphere volume, packing density)
- 10^{-4} = order of magnitude of the dimensional deviation
- $D_f = 3 - \xi$ = effective fractal Hausdorff dimension

Mathematical Equivalence

Numerical Identity

Both interpretations lead to the identical numerical value:

$$\xi_{\text{topological}} = \frac{4}{30000} = 0.000133\bar{3} \quad (8)$$

$$\xi_{\text{fractal}} = \frac{4}{3} \times 10^{-4} = 0.000133\bar{3} \quad (9)$$

The formulations are mathematically equivalent!

.4 Physical Unification

Compactification as a Bridge

The connection between both perspectives is established through the concept of **compactification**:

Unifying View

Fundamental Level:

4-dimensional torsion crystal with compact 4th dimension

⇓ Compactification at sub-Planck scale

Effective Level:

3-dimensional space with fractal correction $D_{\text{eff}} = 3 - \xi$

⇓ Observable consequences

Experimental Level:

~1–2% deviations in precision measurements

Mathematical Formulation

Compactification Radius

The 4th dimension is compactified on a circle:

$$r_4 = \xi \cdot \ell_P \approx 1.33 \times 10^{-4} \cdot 1.616 \times 10^{-35} \text{ m} \approx 2.15 \times 10^{-39} \text{ m} \quad (10)$$

This scale is **sub-Planck** and not directly observable.

Kaluza-Klein Reduction

After dimensional reduction (standard method of Kaluza-Klein theory), the compact dimension appears as a fractal correction:

$$D_{\text{eff}} = 3 + \left(\frac{r_4}{\ell_{\text{typical}}} \right)^{D_f - 3} \approx 3 - \xi \quad \text{for} \quad \ell_{\text{typical}} \gg r_4 \quad (11)$$

(Note of 30 Sept. 2026: with $D_f - 3 = -\xi$, $(r_4/\ell)^{-\xi} = (\ell/r_4)^\xi \approx 1 + \xi \ln(\ell/r_4) \approx 1$, so $D_{eff} \approx 4$, not $3 - \xi$.)

Interpretation: The compact 4th dimension "smears out" into the fractal correction!

Common Predictions

Both formulations lead to **identical** physical predictions:

Observable	4D Formulation	Fractal Formula- tion	Value
ξ parameter	4/30000	$(4/3) \times 10^{-4}$	1.333×10^{-4}
Sub-Planck factor	$f = 7500$	$f = 1/\xi$	7500
Fine structure α^{-1}	$\pi^4 \cdot \sqrt{2}$	$\pi^4 \cdot \sqrt{2}$	137.757
Higgs VEV	$E_P/(f^4 \cdot (\pi/2) \cdot 10)$	Identical	246.71 GeV

Table 1: Identical predictions of both formulations

(Corrected on 29 Sept. 2026: the Higgs VEV row previously gave $E_P/(f^2 \sqrt{4\pi})$ – this form gives 6.1×10^{10} GeV; the formula from Doc. 149 reads $E_P/(f^4 \cdot (\pi/2) \cdot 10)$.)

(Corrected on 30 Sept. 2026: the sub-Planck factor row previously gave $f = 1/(4\xi)$ – with $\xi = 4/30000$ this yields 1875; $7500 = 1/\xi$.)

.5 Detailed Correspondences

Energy Distribution

4D Formulation (Document 149)

$$E_{\text{higgs}} = \frac{E_P}{f^4} \quad (12)$$

Narrative: The Planck energy is distributed over f^4 cells of the four-dimensional hypercube.

Fractal Formulation (Document 145)

Scaling law:

$$N(r) \propto r^{D_f} = r^{3-\xi} \quad (13)$$

For large scales ($r \rightarrow f$):

$$N(f) \propto f^{3-\xi} \approx f^3 \cdot (1 - \xi \ln f) \approx f^3 \cdot 0.99881 \quad (14)$$

(Corrected on 30 Sept. 2026: previously $f^3 \cdot 0.9867 - \xi \ln 7500 = 1.19 \times 10^{-3}$, hence $f^3 \cdot 0.99881$; 0.9867 is $K_{\text{frac}} = 1 - 100\xi$, not this expression.)

Connection

The f^4 scaling in 4D corresponds to the fractal correction in 3D:

$$f^4 = f^3 \cdot f = (\text{3D volume}) \times (\text{compact dimension}) \quad (15)$$

Symmetry Breaking

4D Formulation (Document 149)

Pentagonal symmetry breaking:

- Factor: $5^4 = 625$ appears in $\xi = 4/30000$
- Golden ratio: $\varphi = (1 + \sqrt{5})/2$
- Deviation: $\sim 2\%$ in observables

Fractal Formulation (Document 145)

Correction factor:

$$K_{\text{frac}} = 1 - 100\xi \approx 0.9867 \quad (16)$$

Describes the cumulative deviation over many orders of magnitude.

Equivalence

$$K_{\text{frac}} \approx 0.9867 \Leftrightarrow \text{approx. 1.33\% correction} \Leftrightarrow \sim 2\% \quad (17)$$

$\sim 2\%$ in observables Both describe the same physics!

Sub-Planck Structure

4D Formulation (Document 149)

$$\ell_0 = \frac{\ell_P}{f} = \frac{\ell_P}{7500} \quad (18)$$

Fractal Formulation (Document 145)

$$\Lambda_0 = \xi \cdot \ell_P = \frac{4}{30000} \cdot \ell_P = \frac{\ell_P}{7500} \quad (19)$$

Result

Identical Sub-Planck Scale

$$\Lambda_0 = \ell_0 = \frac{\ell_P}{7500} \approx 2.15 \times 10^{-39} \text{ m} \quad (20)$$

Both formulations predict exactly the same fundamental length scale!

.6 Clarification: No 5 Dimensions

Common Misconception

Important Clarification

Neither Document 149 nor 018 uses 5 spatial dimensions!

The number "5" appears in the theory as:

- Pentagonal symmetry (5-fold rotational symmetry)

- Golden ratio: $\varphi = (1 + \sqrt{5})/2$
 - Factor $5^4 = 625$ in the prime factorization of 7500
- This does **NOT** mean 5 dimensions, but rather 5-fold symmetry in 4D space!

The Role of Pentagonal Symmetry

$$4D \text{ torsion crystal} \xrightarrow{\text{Local structure}} \text{Tetrahedron (4-fold)} \quad (21)$$

$$\downarrow \text{ Global symmetry} \quad (22)$$

$$\text{Pentagon (5-fold)} \xrightarrow{\text{Incompatibility}} \text{Quasicrystal} \quad (23)$$

$$\downarrow \quad (24)$$

$$\text{Symmetry breaking} \Rightarrow \sim 2\% \text{ deviations} \quad (25)$$

The 5-fold symmetry is **embedded within** the 4D structure, not an additional dimension!

.7 Experimental Consequences

Identical Predictions

Both formulations predict the same experimental tests:

Modified Coulomb Law (from Document 145)

$$F_{\text{Coulomb}} \propto \frac{1}{r^{2-\xi}} \approx \frac{1}{r^2} \cdot \left(1 + \xi \ln \frac{r}{\ell_P}\right) \quad (26)$$

(Corrected on 30 Sept. 2026: previously $1/r^{1+\xi} \approx (1/r^2)(1 - \xi \ln(r/\ell_P)) - 1/r^{1+\xi}$ is not $\approx 1/r^2$; according to Doc. 145, $F \propto 1/r^{D_f-1} = 1/r^{2-\xi} = r^{-2} r^\xi \approx r^{-2}(1 + \xi \ln r)$, with the opposite sign of the correction.)

Anomalous Magnetic Moments (from Documents 018, 149)

Geometric prediction:

$$\frac{\Delta a_{\tau-\mu}}{\Delta a_{\mu-e}} = f^{1/3} - 1 = 7500^{1/3} - 1 \approx 18.57, \quad a_\tau = a_\mu + \Delta a_{\tau-\mu} \approx 1.282 \times 10^{-3} \quad (27)$$

(Corrected on 30 Sept. 2026: previously $a_\tau = f^{1/3} - 1 = 7500^{1/3} - 1 \approx 1.282 \times 10^{-3} - 7500^{1/3} - 1 = 18.57$ is the ratio $\Delta a_{\tau-\mu}/\Delta a_{\mu-e}$ (Doc. 018 Rev. 12, 158); the tau value 1.282×10^{-3} follows from it with $\Delta a_{\mu-e} = 6.27 \times 10^{-6}$ and $a_\mu = 1.16592 \times 10^{-3}$.)

Higgs Vacuum Expectation Value (from Document 149)

$$v = \frac{E_P}{f^4 \cdot (\pi/2) \cdot 10} = \frac{\xi^4}{5\pi} E_P \approx 246.71 \text{ GeV} \quad (28)$$

(Corrected on 29 Sept. 2026: previously $v = \frac{E_P}{f^2} \cdot \frac{1}{\sqrt{4\pi}}$ – copied incorrectly from Doc. 149; this form gives 6.1×10^{10} GeV. The value 246.71 GeV holds with $f = 7491.91$ as in Doc. 149; with $f = 7500$ one obtains 245.65 GeV. See Doc. 383.)

(Note of 2 Oct. 2026: the factor 10 is neither derived nor motivated but fitted to the measured value: in the working state of February 2026, $m_P/(f^4 \cdot \pi/2)$ gave 2467 GeV instead of 246 GeV, and the gap was closed with $1/10$. If the bare $v = 248.93$ GeV of the ladder is inserted instead of the measured v , the formula requires $10 K_{\text{frak}} \approx \pi^2$ instead of 10; the factor 10 would then be a mix-up of the bare ladder value with the SI comparison value (choice, open). Comparison of the variants in Doc. 387.)

Experimental value: $v_{\text{exp}} = 246.22 \text{ GeV}$

Deviation: 0.2%

Independence from the Formulation

Experimental Equivalence

All experimental predictions are **independent** of the chosen perspective (4D-geometric vs. fractal-analytical).

An experiment **cannot distinguish** which formulation is “correct” – because both describe the same physics!

.8 Complementarity of Perspectives

Advantages of the 4D Perspective (Documents 149, 018)

Strengths:

- Intuitive geometric visualization
- Clear physical interpretation (torsion, windings)
- Direct connection to Kaluza-Klein theories
- Narrative power for explanations

Use cases:

- Energy distribution (f^4 scaling)
- Projections 4D $\rightarrow$ 3D
- Topological considerations

Advantages of the Fractal Perspective (Document 145)

Strengths:

- Mathematically precise scaling laws
- Direct connection to fractal geometry
- Correction factors for physical laws
- Analytical computability

Use cases:

- Correction factor K_{frac}
- Modifications of force laws
- Dimensional analysis

Recommendation: Use Both**Optimal Strategy**

The best description of T0 theory uses **both** perspectives complementarily:

- **4D view** for intuitive geometric explanations and narrative presentations
- **Fractal view** for precise mathematical calculations and analytical derivations

Neither perspective is “more correct” than the other – they complement each other!

.9 Conclusion**Main Result**

The formulations in Documents 149, 018 (4D torsion crystal) and 145 (fractal dimension $D_f = 3 - \xi$) are fully compatible.

They describe the same physical phenomenon from two complementary perspectives:

**Key Connection**

The parameter $\xi = 4/30000$ unifies both views:

- **Topologically:** 4 fundamental dimensions, 3 observable
- **Fractally:** 4/3 geometric factor (sphere packing)
- **Both:** $\xi \approx 1.33 \times 10^{-4}$ – identical numerical value!

Practical Recommendation

Usage in Practice

For optimal presentation of T0 theory, both perspectives should be used **together**:

- Use the **4D-geometric language** for intuitive explanations, narrative presentations, and conceptual discussions
- Use the **fractal language** for precise calculations, analytical derivations, and mathematical rigor

There are **no contradictions** – only complementary descriptions of the same fundamental physics!
