

Charged lepton masses on log scale — FFGFT Δp structure

$$m_i = r_i \cdot \xi^{p_i} \cdot v \quad \text{with} \quad (r_e, r_\mu, r_\tau) = (4/3, 16/5, 25/9), \quad (p_e, p_\mu, p_\tau) = (3/2, 1, 2/3), \quad \xi = 4/30\,000$$

$$v/m_\tau = 1/(r_\tau \cdot \xi^{(2/3)}) = 138.4 \approx 137.04 = 1/\alpha$$

Purple: FFGFT Δp intervals (lepton Yukawa exponents). Teal, dashed: $\log(v/m_\tau) \approx \log(1/\alpha)$ — Rivero 2005 observation, in FFGFT derived from ξ .
