## Preamble

This document is the ongoing correction register of the FFGFT corpus. It records *exclusively* two items per entry: **(1)** the correction or clarification in brief form and **(2)** which document already contains the implemented correction.

Elaborations, derivations, and status notes belong in the target documents or in the archive editions (Doc. 190-Archive-1: up to R85; Doc. 190-Archive-2: R86–R114).

**Principle (append-only):** Source documents are *not* revised. Every declared correction must be visible in an *active* document of the corpus — either in a new successor document containing the corrected version, or as an addendum at the end of the affected document. An entry that exists only in the archive but appears in no active document is not complete. The column “Implemented in” of the register table names the active document carrying the correction; it remains empty while that is still outstanding.

**Entry types:** K = Correction (content error), P = Precision (clarification, not an error), R = Register entry (revision of a previously booked statement).

## .1 Register Table

Full elaborations: Doc. 190-Archive-1 (K1–K7, P1–P43, R1–R85), Doc. 190-Archive-2 (R86–R114, K-041).

| No. | Concerns                                         | Subject                                                                                                                   | Implemented in              |
|-----|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| K1  | 049 (HTML)                                       | $\xi = \lambda_h^2 v^2 / (16\pi^3 m_h^2)_i$ ; earlier version counted one 2-sphere too many                               | Doc. 310                    |
| K2  | 116 (Tab.)                                       | $r_\tau = 25/9$                                                                                                           | Docs. 016, 046, 116 (De+En) |
| K3  | 018 (Explorer)                                   | $a_e = 2\pi^2 / (f \cdot k)$                                                                                              | Doc. 018                    |
| K4  | 267, 268                                         | Factor 3 = three observable spatial dimensions ( $k_{\text{obs}}^2$ from $n_{1,2,3}$ , fourth direction = time unfolding) | Docs. 267, 268              |
| K5  | 275 (script v3)                                  | Three errors in v3; all fixed in v4 (11 June 2026)                                                                        | Script v4                   |
| K6  | 004, 025, 030, 039, 041, 053, 061, 063, 068, 081 | Redshift is achromatic: $1+z = e^{\xi x}$ independent of $\lambda$                                                        | Doc. 280                    |
| K7  | rsa/ (14 HTML pages)                             | Calculation path, labels and method text corrected; no warning boxes, pages describe themselves                           | rsa/ directly               |
| P1  | 116, 158                                         | Both correct; 0.001 % for external use                                                                                    | Docs. 116, 158 (addendum)   |
| P2  | several                                          | $\hbar$ follows from $\xi$ via $L_0 = \xi \cdot \ell_P$                                                                   | corpus-wide                 |
| P3  | 173–176                                          | Two parameters: $\xi_0$ (geom.) and $\xi_{\text{Higgs}}$ (alg.)                                                           | Docs. 173–176               |
| P4  | 180–182                                          | $L_0$ = geometric fundamental length                                                                                      | Doc. 180                    |

| No.  | Concerns                                         | Subject                                                                                | Implemented in                |
|------|--------------------------------------------------|----------------------------------------------------------------------------------------|-------------------------------|
| P5   | several                                          | Mass structure from $\xi_i \sim 1\%$ agreement                                         | corpus-wide                   |
| P6   | 116, 158                                         | Koide only with numerical values (non-closure, Doc. 193)                               | Doc. 193                      |
| P7   | 005, 008, 019, 086, 189, 202                     | Scale structure from recursion $\mathcal{R}$                                           | respective docs               |
| P8   | 005, 008, 012, 014, 041, 060, 133, 141, 159, 181 | Geometric scaling / fractal correction                                                 | respective docs               |
| P9   | 005, 006, 042, 046                               | Columns "scaling class" + "SM correspondence"; quarks via $m = r \xi^p v$              | respective docs               |
| P10  | 009                                              | $K = R_{pe}/(4/3)^7$ : empirical anchor; factor 1.314 implicitly defined               | Doc. 009                      |
| P11  | 025, 003, 133                                    | $(1 - 275/4 \cdot \xi)$ , $\Delta = 0.0002\%$ ; Docs. 003 and 133 use different models | respective docs               |
| P12  | 022, 230                                         | Two observables: cumulative (022) vs. elementary $\xi/(2\pi)$ (230)                    | Docs. 022, 230                |
| P13  | 013, 025, 061                                    | $\xi_{\text{FFGFT}}/\xi_{\text{UIFT}} \approx 414,684$ ; table in 013 reconstructed    | Doc. 013                      |
| P14a | 041, 268                                         | Fractal path lengthening (geometric path stretch); energy loss only artefact           | Docs. 041, 268                |
| P15  | 061, 041                                         | Marked as $\Lambda$ CDM reference quantity; static universe has no cosmological $z$    | Doc. 061                      |
| P16  | 026, 064, 181                                    | $H_0$ is emergent (decompactified), not fundamental                                    | Doc. 263; 026/064/181 flagged |
| P17  | 028                                              | DE/DM relation circular; MOND partially derived                                        | Doc. 028 (addendum)           |
| P18  | 267                                              | Both pictures empirically indistinguishable; decision is theoretical                   | Doc. 267                      |
| P20  | 267, 268                                         | Form: dimensionless $\xi$ -ratio ( $R_H/\ell_P$ ) is fixed                             | Docs. 267, 268                |
| P29  | 268                                              | Sequence $\{1, 6, 14, 26\}$ read from data, not derived forward                        | Doc. 268, open <b>[S]</b>     |
| P30  | 268                                              | Naive spherical Bessel sum does not reproduce $\{3, 18, 42, 78\}$                      | Doc. 268, open <b>[S]</b>     |
| P31  | 268                                              | $T^4$ gives harmonic backbone $1 : 2 : 3 : 4 : 5$ (symmetric resonance $k^2 = 3n^2$ )  | Doc. 268 <b>[B]</b>           |
| P32  | corpus-wide                                      | $H_0$ is an imported external calibration, not derived                                 | Doc. 309                      |

| No. | Concerns                     | Subject                                                                                         | Implemented in           |
|-----|------------------------------|-------------------------------------------------------------------------------------------------|--------------------------|
| P33 | 009, 042, 181                | Form of $\xi$ forward: harmonic 4/3, spatial dimensions 3, $2^2 = 4$ from geometry              | Doc. 009                 |
| P34 | 181, 013                     | 3+1 is empirical input; earlier "follows necessarily" claim overstated                          | Doc. 181                 |
| P35 | corpus-wide                  | $\xi^N$ triviality: " $X = \xi^N$ " is meaningless on its own                                   | Docs. 182, 250 (addenda) |
| P36 | 182, cosm. sector            | $R_H = c/H_0$ is the Hubble length, not the universe size                                       | Doc. 182                 |
| P37 | 009, 188, 271, 272, 275      | Three levels clearly separated: micro/meso/macro                                                | respective docs          |
| P38 | 275                          | $1/\varphi$ is a transit point, not a fixed point                                               | Doc. 275                 |
| P39 | 182, 267, 277, corpus-wide   | $H_0/R_H$ status: no framework derives from first principles                                    | Doc. 309                 |
| P40 | 005, 006, 011, 012, 133, 275 | Only ratios exact; absolute values carry fractal/SI correction via bridge constants             | corpus-wide              |
| P41 | 267, 280, 221                | Checked, not booked (degeneracy risk)                                                           | Doc. 267                 |
| P42 | 282, 292                     | One declared reference point: $m_\mu/m_e$                                                       | Doc. 292                 |
| P43 | 006, 011, 292                | $K_{\text{frak}}$ not explicit in calc_En.py                                                    | note                     |
| P44 | 253, 190                     | $\xi$ as linewidth: disproved for this Shor setup; window width is a measurement-setup property | Doc. 253; Archive-2      |
| R41 | 284 (cf. 270, 249)           | Type-I decompactification is mode-preserving embedding (lossless)                               | Doc. 270 <b>[B]</b>      |
| R42 | 270 (cf. 248)                | Time is relational; symmetry breaking is the measurement process                                | Doc. 270 <b>[B]</b>      |
| R43 | 285, 283                     | $C_3 < A_5$ , $T^7 = T^4 \times T^3$ : HLV $\supset$ FFGFT at group/dimension level             | Doc. 285 <b>[B]</b>      |
| R44 | 272, 285                     | $\varphi$ acquires meaning as eigenvalue in HLV 5-fold/perp sector, not in FFGFT                | Doc. 272 <b>[B]</b>      |
| R45 | 285, 282–284                 | Quasicrystal: structure/diffraction spectrum point-like; dynamical spectrum continuous          | Doc. 285 <b>[B]</b>      |
| R46 | 296 (cf. 025, 026, 063, 156) | Open test point: intermediate-scale formulation cross-cuts corpus line                          | open <b>[S]</b>          |
| R47 | 285, 297, 298                | Spiral-time window not additive but internal (bounded excerpt)                                  | Doc. 285 <b>[B]</b>      |
| R48 | 304 (cf. 295, 301, 303)      | Overstatement was in the mail only; document was correct                                        | Doc. 304                 |

| No. | Concerns                          | Subject                                                                                   | Implemented in              |
|-----|-----------------------------------|-------------------------------------------------------------------------------------------|-----------------------------|
| R49 | 304, 305                          | Consolidated first-mention footnote for U1/U2/U3 and $M_t/M_B$ (Krüger 2026)              | Docs. 304, 305              |
| R50 | 025, 063, 061, 064, 078           | Justification replaced; conclusion (no singular beginning; finite core $L_0$ ) unchanged  | Doc. 306                    |
| R51 | 049 (cf. 095, 306, 267, 302)      | $T_0$ never denoted time zero, but the smallest possible time interval; notational legacy | Doc. 049 (archived)         |
| R52 | 101, 165                          | $L_0 = \xi \ell_P = 2.155 \times 10^{-39}$ m; earlier values corrected                    | Doc. 180 <b>[K]</b>         |
| R53 | 267 §518                          | Table row "source of scale": correctly "set / calibrated to $H_0$ "                       | Doc. 267 <b>[B]</b>         |
| R54 | 292, 306                          | $N_0 \approx 38.6$ is a ladder-internal factor, not a fundamental unit; value open        | Doc. 292 <b>[S]</b>         |

## .2 Note on R92 (self-correction)

R92(ii) concerned a statement in the *old* Doc. 190 (edition 23 August 2026, now Archive-2), Precision 4: the statement classified there as an internal consistency check — that an object with  $M_0 = \xi m_P/2$  would have Schwarzschild radius exactly  $L_0$  — is an *identity* (from  $r_s = 2GM/c^2$  and  $\ell_P = Gm_P/c^2$  it follows that  $r_s(xm_P/2) = x\ell_P$  for every  $x$ ). It tests neither  $\xi$  nor the exponent in  $L_0$ . The classification as “probe” was too strong. This finding is resolved in the present new edition; the Archive-2 edition documents the origin.

## .3 Currently Open Bridges

- $\tau_\mu$  directly from FFGFT, without detour via  $G_F$  and  $v$  (R112, Doc. 351) **[S]**
- Why do  $\varepsilon_i$  decrease with generation? Attribution to QED extraction + SI projection (R113-bridge, Doc. 352 §10) **[S]**
- Koide amplitude  $d/c = \sqrt{2}$  from FFGFT geometry (Doc. 352 §8) **[S]**
- K-041-a/b/c: candidate formulas to be clarified by author review
- Cosmic exponent  $41/4$  to be derived forward (P20)
- CMB peak selection:  $\{1, 6, 14, 26\}$  to be generated forward (P29/P31)
- $C_\ell$  projection: physical source/window function (P30)
- $\Omega_{\text{DM}}$  quantitatively model-neutral (P17)
- Spectral dimension  $d_s = 1.86$  vs. FFGFT  $\approx 2$
- Basis mass  $M_{\text{basis}} = m_P$  in the fundamental sector: independent justification needed (R90) **[S]**

- Adversarial  $D_4$  operator specificity test against fitted comparison carriers (R95) **[S]**
- $\iota$ -embedding  $HLV \subset \text{FFGFT}$  in the time sector (Doc. 297)
- R91: label correction  $\lambda \rightarrow M_{\text{basis}}$  in Docs. 019/201 pending **[S]**
- R46: intermediate-scale formulation (Doc. 296) cross-cuts corpus line; not yet addressed **[S]**
