

The algebraic structure of the compact geometry.

Volume 7 covers Docs. 311 to 343. The lattice is read as the index set of the Fourier modes — geometry becomes spectrum and fibre. Then follow the spectral theory of the FFGFT tori, the algebraic derivation of $SU(3)_c$ from $\mathbb{Z}_3$ triality and the Weinberg angle at M_Z with full renormalisation-group running.

Further documents treat the Hawking mechanism, the self-adjointness of the fundamental operator, resonance and synchronisation, and two routes from the discrete to the continuum.

The Galois bridge closes the volume: the Frobenius automorphism and the sector pairing are structurally identical; via $GF(27)^*$ follow mass ratios, the neutrino hierarchy and the zeta function of the $T^4/\mathbb{Z}_3$ torus.

Johann Pascher

Johann Pascher is an independent theoretical physicist and author of FFGFT / T0 theory. In more than 300 documents he develops a geometric framework that derives the fundamental constants of physics from a single dimensionless parameter ξ . All work is openly accessible.
