

All constants of nature from a single geometric number?

The T0 theory (time–mass duality) reformulates the foundations of theoretical physics: it is not time that is relative but mass — anchored to an absolute time T_0 . This inversion yields a universal geometric constant $\xi = 4/30000$ that unites particle masses, coupling strengths and fundamental constants in a single framework.

Part 1 of the complete works lays the mathematical foundations: the intrinsic time–field–mass relation $\tilde{T} \cdot m = 1$, the derivation of particle masses and of the fine-structure constant $\alpha \approx 1/137$, the anomalous magnetic moment $g-2$, the gravitational constant G and the neutrino masses — all from one geometric parameter.

Quantum mechanics, relativity and cosmology on a common geometric foundation.

Johann Pascher

Johann Pascher is an independent theoretical physicist and author of FFGFT / T0 theory. In more than 300 documents he develops a geometric framework that derives the fundamental constants of physics from a single dimensionless parameter ξ . All work is openly accessible.
