

Numerical predictions and new series.

Volume 4 collects 37 documents written after the original three-volume plan: extensions on Bell tests, asymmetry and the Lagrangian, and a connected series of numerical predictions — the Koide relation, $g-2$, lepton lifetimes, the H_0 ratio and the LiNbO_3 dispersion exact to 16 digits.

Further series cover photonics and qubit states, Shor’s algorithm, spin stability and the early justifications of the torus geometry and of the length L_0 .

Up to Doc. 184 the theory is worked out on layer 1: compact T^4 , correction-free description in natural units.

Johann Pascher

Johann Pascher is an independent theoretical physicist and author of FFGFT / T0 theory. In more than 300 documents he develops a geometric framework that derives the fundamental constants of physics from a single dimensionless parameter ξ . All work is openly accessible.
